TENSORSTUDIO / BUILT FOR BITTENSOR

One idea. Every next step.

Explore. Build. Evaluate. Observe.

A browser workspace for useful intelligence networks.

PROJECT BRIEF / TENSORSTUDIO

A clearer path from idea to useful intelligence.

A browser workspace for Bittensor builders, subnet teams and researchers.

The problem

Subnet development spans task design, code, evaluation, processes and chain state. Teams lose context moving between tools, and an attractive prototype can hide an unclear evaluation problem.

The product

TensorStudio connects a guided assistant, editable code, live previews, structured subnet recipes, scoring reports, native processes and a read-only explorer.

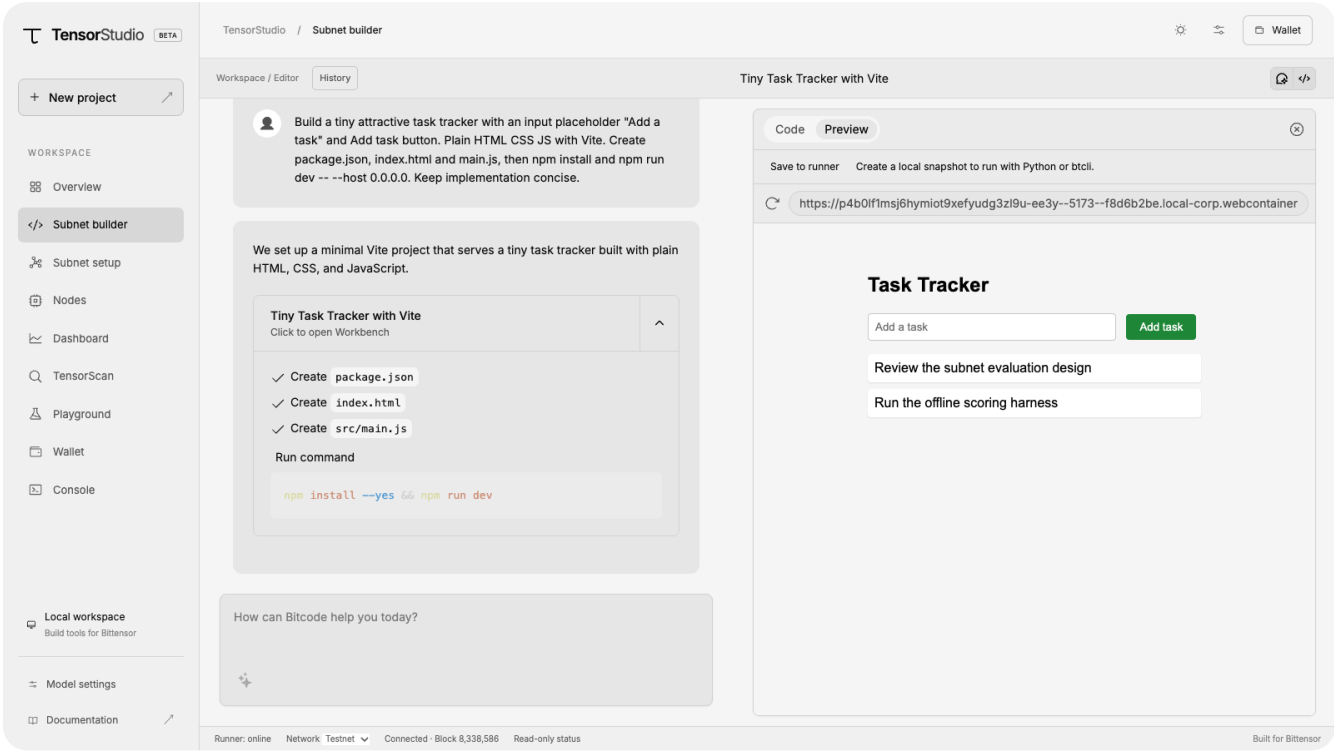

The core loop

Explore → Build → Define → Evaluate → Run → Observe

Built by Somesh Talligeri · tensorstudio-workbench.vercel.app

PRODUCT EXPERIENCE

Make the next step real.

For the builder

Describe a problem, inspect a suggested plan and build an interface. Review generated files beside a working preview.

For the subnet designer

Provide labelled QA/classification data. Inspect the task, scoring and weight blocks before assembling reviewed templates.

For the operator

Read process logs, manage lifecycle and use authenticated runner commands. Inspect chain observations independently in TensorScan.

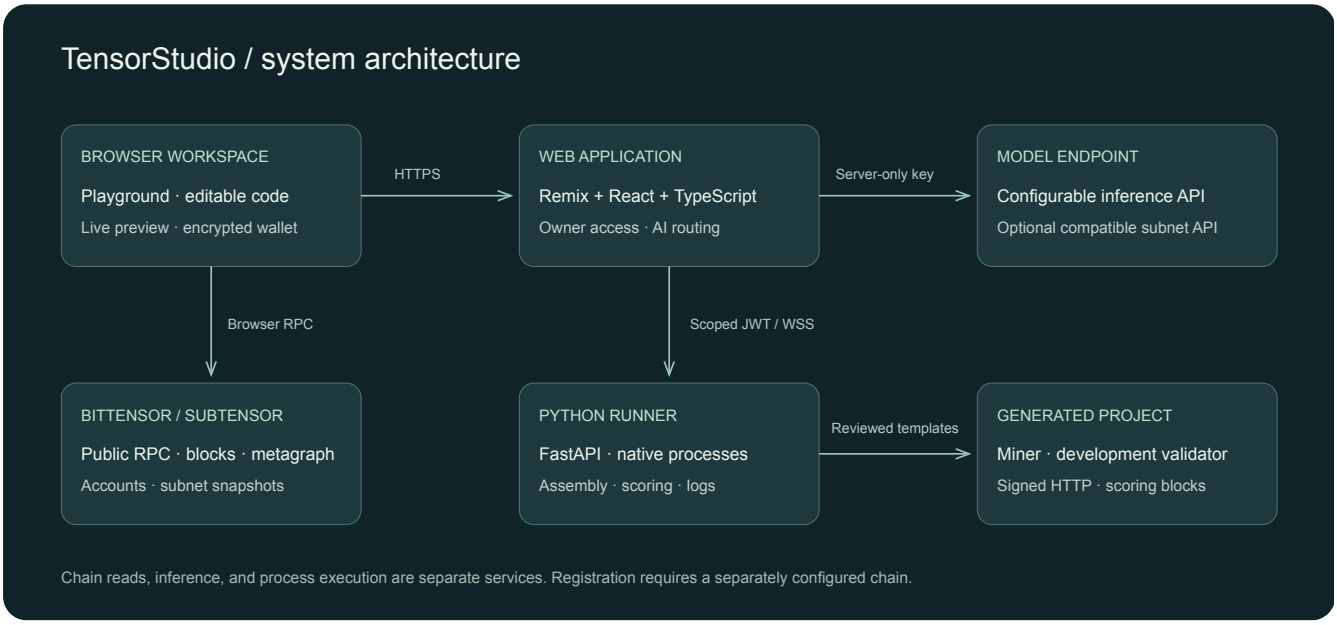

For the researcher

Use controlled offline fixture reports to understand scoring behavior. Simulated timing is labelled explicitly.

Public chain reads, local fixture scores and miner execution provide different kinds of evidence.

ARCHITECTURE / BITTENSOR FIT / BUSINESS

Connected tools. Explicit responsibilities.

Why Bittensor

The workflow follows Bittensor's task, miner, validator and subnet roles. Subtensor supplies chain observations; signed HTTP authenticates generated miner requests. Inference uses a separately configured endpoint. A registered subnet serving the assistant is not asserted.

A sustainable product direction

Potential revenue: team subscriptions, managed runners, private evaluations, observability and integration services. Validate customer demand and measure compute, inference, storage and support costs before setting prices. No revenue or token return is promised.

Use the workspace

Open TensorStudio · Bittensor documentation

The hosted free runner can sleep and reset files. A private development chain and durable production infrastructure require separate configuration. Registration and rewards are separate from starting a process.
